

## NetsBlox Lesson: Plotting COVID-19 data

This lesson builds on the Weather project and the introductory lesson on plotting. We will display the same map as the weather app. But when we click on it, it will show the plot of COVID-19 pandemic data. This is how it will look like:

Start from the weather app. The stage code for displaying an interactive Google Map background is exactly what we need, so we do not need to modify it. However, you can change the default zoom level to something smaller to start with the map of the entire US.

We'll have two sprites with very similar code: one for the cases and one for the death counts. Start with the cases, which is the top plot in the figure above. The first part of sprite code is almost identical to the weather app:

```

when I receive Map Clicked
hide
go to mouse-pointer
script variables sprite lat sprite long
set sprite lat to call GoogleMaps / getLatitude y position
set sprite long to call GoogleMaps / getLongitude x position
set country to call Geolocation / country sprite lat sprite long
set state to call Geolocation / state* sprite lat sprite long
    
```

We get the location of the mouse click and figure out the country and state where the click occurred. Note we created a number of variable including `country` and `state`.

Next, we need to consider the data the COVID-19 service returns. As you can see below, the first column does not contain numbers, but actual dates. So, plotting it is a bit more complicated.

	A	B
1	03/05/2020	1
2	03/06/2020	1
3	03/07/2020	1
4	03/08/2020	3
5	03/09/2020	3
6	03/10/2020	7
7	03/11/2020	9
8	03/12/2020	18
9	03/13/2020	26
10	03/14/2020	32
11	03/15/2020	39
12	03/16/2020	52
13	03/17/2020	74
14	03/18/2020	79
15	03/19/2020	154
16	03/20/2020	233
17	03/21/2020	371
18	03/22/2020	505
19	03/23/2020	614
20	03/24/2020	772
21	03/25/2020	916
22	03/26/2020	1097
23	03/27/2020	1318
24	03/28/2020	1511
25	03/29/2020	1720
26	03/30/2020	1917
27	03/31/2020	2391
28	04/01/2020	2933
29	04/02/2020	3013
30	04/03/2020	3067
31	04/04/2020	3322
32	04/05/2020	3633
33	04/06/2020	3802
34	04/07/2020	4139
35	04/08/2020	4363
36	04/09/2020	4634
37	04/10/2020	4891
38	04/11/2020	5132
39	04/12/2020	5508

call COVID-19 / getConfirmedCounts US Tennessee city

Fortunately, the chart service accepts options that specify that we want to plot time series data and how to interpret the dates. Here are the options we need to set for the COVID-19 data:

```

set options to
  list isTimeSeries true
  list timeInputFormat %m/%d/%Y
  list timeDisplayFormat %m/%d
  list types list lines
  list height stage height / 2
  list width stage width
  
```

Specifically, we need to set the `isTimeSeries` option to `true` and the `timeInputFormat` to `%m/%d/%Y`. This rather cryptic text means that the date is to be interpreted as a month (`%m`) first, followed by a slash, then a day (`%d`), followed by a slash, and finally a year value (`%Y`). The `timeDisplayFormat` specifies how the labels should look like in a similar fashion. The rest of the options specify that we want a line plot (not a bar chart for example) and the height of the image should be half of the stage. Remember, we have two plots to display.

Next, we have to treat US states and countries differently since within the US we want to see data for individual states, while for the rest of the world, we stick to country level data.

```

if country = United States
  set cases to call COVID-19 / getConfirmedCounts US state city
  set value of title in options to
  join Cumulative Number of Confirmed COVID-19 Cases in state
else
  set cases to call COVID-19 / getConfirmedCounts country state city
  set value of title in options to
  join Cumulative Number of Confirmed COVID-19 Cases in country
  
```

We call the `getConfirmedCounts` RPC of the COVID-19 service accordingly. We use the `state` variable in the first call (US), but not the second (rest of the world). We also set the title of the plot with the name of the area we clicked at.

What if we clicked on a place that has no data, for example, an ocean? Instead of the data list, we would get an error message from the RPC. So, we need to handle that case:

```

if is cases a list ?
  go to x: 0 y: stage height / 4
  switch to costume call Chart / draw list cases options
  say
  show
else
  show
  switch to costume Untitled
  say No data for this location... for 2 secs
  hide
  
```

If the returned result is a list, we are in business. We go to the center point of where we want the plot: centered on x, but up a quarter height in y. Then we simply call the chart service `draw` RPC and change the costume and show ourselves.

But if there was an error, we just display an error message for 2 seconds in the else branch and hide ourselves to show the map background again. Here is the entire script in one place.

```

when I receive Map Clicked
hide
go to mouse-pointer
script variables sprite lat sprite long
set sprite lat to call GoogleMaps / getLatitude y position
set sprite long to call GoogleMaps / getLongitude x position
set country to call Geolocation / country sprite lat sprite long
set state to call Geolocation / state* sprite lat sprite long
set options to
  list isTimeSeries true list timeInputFormat %m/%d/%Y
  list timeDisplayFormat %m/%d list types list lines
  list height stage height / 2 list width stage width
if country = United-States
  set cases to call COVID-19 / getConfirmedCounts US state city
  set value of title in options to
    join Cumulative-Number-of-Confirmed-COVID-19-Cases-in state
else
  set cases to call COVID-19 / getConfirmedCounts country state city
  set value of title in options to
    join Cumulative-Number-of-Confirmed-COVID-19-Cases-in country
if is cases a list?
  go to x: 0 y: stage height / 4
  switch to costume call Chart / draw list cases options
  say
  show
else
  show
  switch to costume Untitled
  say No data for this location... for 2 secs
  hide
  
```

We are not quite done. When we click the map, we show the plots, but when we click the plot or press any key, we should hide the plots and show the map again. It takes a few simple scripts:

That's it for the first sprite! The second sprite displays a plot with the death counts. It is almost identical to the first sprite. It calls a different COVID-19 RPC of course. Also, it makes a bar chart as opposed to a line plot:

And finally, it does not need to display an error message in case there is no data since that was taken care of by the first sprite already.

The final solution is below. It also includes a little helper sprite that displays some helpful directions when the project starts:
